About DT Nexus

6 min

DT Nexus is a product of **Digital Transitions** (a.k.a. DT Heritage or DT). DT makes hardware and software and provides services to museums, libraries and archives doing preservation-grade digitization.

DT Nexus is a companion app to Capture One, extending its functionality by providing tools and workflows specific to digitization.

Main Features

Color Profiling

The creation of standards-compliant color profiles that improve color and tone accuracy.

Standards Validation

Checking if the system complies with FADGI or ISO Standards, following the best practice of evaluating a target other than the one used to make the color profile. Currently, only Color/Tone are evaluated – more metrics will be added over time.

Light Control

Control of DT Stellar lighting including setting Power, Grouping, Naming, and Mode (Flash or Continuous)

Fusion

A mode that increases color accuracy by combining two captures using a 6-channel profile. This is especially helpful for subject matter with challenging colorants. DT Stellar Fusion or DT Gemini lighting is required for this feature.

AI Crop & Straighten

Utilize AI to detect heritage materials and their sub-components, enabling precise rules-based automatic cropping (including straightening).

Batch Crop Adjust

A set of tools to adjust the crop of one or more images. For example, you can standardize the width without changing the height or center of each crop.

Made for Heritage Digitization

Unlike most software you interact with on a daily basis, DT Nexus is made for a small niche market – heritage digitization. If you are a member of that community your voice has a large say in the development of this software.

> Please consider **reaching out with your feedback and suggestions** for how DT Nexus could improve your digitization workflow.
